OFFICE OF
SOLID WASTE AND EMERGENCY
RESPONSE

OCT 05 2011

Joseph Knapik
International Paper Products Corporation
98 Sgt TM Dion Way
Westfield, MA 01085

Dear Mr. Knapik:

In your letter of June 9, 2011, and follow-up letter of July 19, 2011, you requested confirmation from the U.S. Environmental Protection Agency (EPA) that Enviro-Fuelcubes (EFC) burned in combustion units are non-waste fuels in accordance with the requirements in 40 CFR part 241.3(b)(4). To be designated as a non-waste fuel under that section, the rule requires that processing of non-hazardous secondary material (NHSM) meets the definition of processing in 40 CFR 241.2. Also, after processing, the NHSM must meet the legitimacy criteria for fuels in 40 CFR 241.3(d)(1). Based on the information provided in your letter and supporting materials, we believe the 40 CFR part 241 regulations would identify EFC generated by the International Paper Products Corporation (IPPC) and burned in combustion units as a non-waste fuel.¹ The remainder of this letter provides the basis for our position. *If there is a discrepancy in the information provided to us, it could result in a different interpretation.*

Enviro-Fuelcubes

IPPC processes non-hazardous raw material feedstocks from “pre-consumer” sources in the industrial, commercial, retail, and institutional market sectors into EFC. The raw materials, outlined in your “Specification Raw Materials” document, include paper and polymer based products, fabrics, textiles, non-halogenated plastics, wood and packaging materials. You specifically state that hazardous wastes and halogenated plastics are prohibited through arrangements with suppliers. You also state that the EFC may have up to 10% non-construction and demolition (C&D) wood, such as clean pallets, lumber scraps, and resinated wood products.

Processing

Processing is defined in 40 CFR 241.2 as operations that transform discarded NHSMs into a

¹ Note that a non-waste determination under 40 C.F.R. Part 241 does not preempt a state's authority to regulate a non-hazardous secondary material as a solid waste. Non-hazardous secondary materials may be regulated simultaneously as a solid waste by the state, but as a non-waste fuel under 40 C.F.R. Part 241 for the purposes of determining appropriate emissions standards under the Clean Air Act for the combustion unit in which it is used.

non-waste fuel or non-waste ingredient, including operations necessary to: remove or destroy contaminants; significantly improve the fuel characteristics e.g. sizing or drying of the material in combination with other operations; chemically improve the as-fired energy content; or improve the ingredient characteristics. Minimal operations that result only in modifying the size of the material by shredding do not constitute processing for purposes of the definition. In your letter, you state that upon arrival, each load is inspected for small metal parts, wires, batteries, garbage and other materials that are not meant to be in the incoming feedstock container. These materials are removed, using in-line magnets for metals. Other reusable or recyclable commodity grade portions of the material are also removed and shipped to domestic and international markets. The EFC manufacturing process then conducts blending, size reduction (cutting and shearing) and densification into a 1.25" X 1.25" X 2" EFC structure. Based on this description—that is, removal of contaminants along with blending, size reduction and densification, we believe the process used to produce EFC meets the definition of processing in 40 CFR 241.2.

Legitimacy Criteria

Under 40 CFR 241.3(d)(1), the legitimacy criteria for fuels includes: 1) management of the material as a valuable commodity based on the following factors—storage prior to use must not exceed reasonable time frames, and management of the material must be in a manner consistent with an analogous fuel, or where there is no analogous fuel, adequately contained to prevent releases to the environment; 2) the material must have meaningful heating value and be used as fuel in a combustion unit that recovers energy; and 3) the material must contain contaminants at levels comparable to or less than those in traditional fuels which the combustion unit is designed to burn. The term contaminants is defined in 40 CFR 241.2 as constituents in the NNSM that will result in emissions of air pollutants under Clean Air Act section 112(b) or the nine pollutants listed under Clean Air Act section 129, including those constituents that could generate products of incomplete combustion.

Manage As A Valuable Commodity

Regarding the first criterion, you state that upon receipt at IPPC, the various materials² are processed into EFC. The processed EFC is then stored in buildings, storage bins and fuel delivery trailers. The EFC is then sold to power plants and kiln operations (lime and cement) for its fuel value. Your permit with the Massachusetts DEP requires that processed materials be stored onsite for no more than 30 days, but that time limit may be exceeded to reach a transportable load (one full truck load).

Based on that information, the material is managed as a valuable commodity and storage does not exceed a reasonable time frame. Although no analogous fuel was identified, storage in buildings, storage bins and fuel delivery trailers is adequate to prevent releases to the environment. Please note that the facilities receiving the material must also manage it as a valuable commodity for the material to remain a non-waste fuel.

² As noted in the regulations, prior to processing, the EFC material may be considered a solid waste and is subject to appropriate federal, state, and local regulations.

Meaningful Heating Value and Used As A Fuel to Recover Energy

Regarding the second legitimacy criterion on meaningful heating value and be used as a fuel in a combustion unit that recovers energy, you state that the EFC has an as-fired fuel value of between 9,000 to 10,000 Btu/pound. As discussed in the final rule, 5,000 Btu/pound was established as a general guideline for meaningful heating value. In addition, power plants and kiln operations recover energy from the use of this material as a fuel. Thus, the material meets this criterion.

Comparability of Contaminant Levels

Regarding the third criterion on contaminant levels, your letter requested confirmation that the EFC meets the contaminant level criterion when compared to coal, petroleum coke, biomass and number 6 fuel oil, fuels that are used in the combustion units for which the unit(s) are designed to burn. You prepared the attached table "IPPC Enviro-Fuelcubes to Traditional Fuels," which compared the EFC contaminant data to the contaminant data for these four traditional fuels as outlined in the materials characterization paper "Traditional Fuels and Key Derivatives."^{3,4,5} Please note that only those constituents identified in the contaminant definition under section 241.2 are relevant with respect to meeting the contaminants legitimacy criterion. Therefore, from the table of contaminant concentrations you submitted, we evaluated only those constituents identified under section 241.2.

As indicated in your attached Table, the EFC meets the legitimacy criterion for contaminant levels when compared to solid traditional fuels and number 6 fuel oil.⁶ This conclusion also presumes that additional constituents for which the EFC was not tested are present at levels comparable to or lower than those in the appropriate traditional fuel, based on your knowledge of the material.

³ The Materials Characterization Paper on *Traditional Fuels and Key Derivatives* can be found at www.epa.gov/epawaste/nonhaz/define/index.htm.

⁴ EPA notes that the contaminant values listed in the *Traditional Fuels and Key Derivatives* MCP for coal (and other traditional fuels) may be revised in the future based on the availability of new or additional data. Any future revisions to the values will not impact the conclusions made in this letter; the values are based upon the data that is available at the time EPA responds to a request.

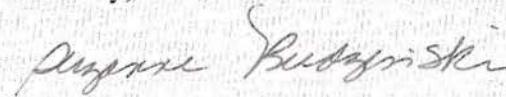

⁵ You may use other data on the contaminant levels in traditional fuels in determining whether the levels are comparable to International Paper Products Corporation's EFCs. That is, other data on the level of contaminants in traditional fuels that your company has or may become aware of may also be considered in determining whether the level of contaminants in International Paper Products Corporation's EFCs are comparable to those in the traditional fuel that the combustion unit is designed to burn.

⁶ The term "volatiles" is not related to the term "volatile organic compound (VOC)" and is not pertinent to the definition of "contaminants" specified in §241.2. Instead, the term "volatiles" comes from a proximate analysis of fuels, a common test performed to characterize fuels by determining percentages for moisture, volatiles, ash, and fixed carbon that add up to 100 percent. In such an analysis, a sample is weighed, burned at a specified temperature, and weighed again. The percent weight difference is called "volatiles" and includes any gases or vapors driven off at the specified temperature, a large portion of which is likely to be non-contaminants.

Overall, based on the information provided in your letter, we believe the facts indicate that the EFC meets both the processing definition and the legitimacy criteria outlined above. Accordingly, we would consider this NHSM a non-waste fuel under the 40 Part 241 regulations.

If you have any other questions, please contact Michael Svizzero of my staff at 703-308-0046.

Sincerely,

Suzanne Rudzinski, Director
Office of Resource Conservation and Recovery

Extractives 95% (EtOH)			No Data												5-3	3.2
Extractives Hot Water			No Data												5-3	16
Starch			No Data												5-3	1.7
Pectin			No Data												5-3	6.1
Arabian C5			No Data												5-3	2
Xylan C5			No Data												5-3	28
Mannan C6			No Data												5-3	14
Galactan C6			No Data												5-3	4.4
Glucom C6			No Data												5-3	56
Rhamman C6			No Data												5-3	0.4
Total non-structural carbohydrates			No Data												5-3	26.5

* Lignin results for IPPC Enviro-Fuelcubes® is a combination of lignin and polymers of petroleum origin. They are inseparable in the extraction. Refer to method sheet below for more information.
